

BOT CHAIN NATIVE

BotSpend

Programmable spending with clear limits.

A secure on-chain spending control layer for teams, applications, wallets, and autonomous agents.

The Problem

02

On-chain spending becomes risky when wallets have no programmable boundaries.

- **Unlimited wallet access**

Giving an application or agent full wallet access can expose more funds than necessary.

- **Weak spending controls**

Teams need simple rules for how much can be spent, by whom, and for what purpose.

- **Poor visibility**

It can be difficult to monitor delegated spending and understand where funds are going.

- **Manual approvals**

Repeated manual transaction approvals reduce the usefulness of automated on-chain workflows.

The Solution

03

BotSpend makes delegated on-chain spending controlled, visible, and programmable.

Set Limits

Define how much a wallet, application, or agent is allowed to spend.

Grant Access

Assign spending permissions without handing over unrestricted control.

Track Activity

See authorized transactions, remaining limits, and spending history.

Revoke Anytime

Update or remove permissions when access is no longer required.

Core Features

04

Simple controls for safer on-chain automation.

Spending allowances

Create wallet or agent spending limits.

Transaction permissions

Control which delegated accounts can initiate payments.

Usage tracking

Monitor spent amount, remaining allowance, and transaction history.

Permission management

Increase, reduce, pause, or revoke access.

On-chain records

Keep transparent records of permission and spending activity.

Dashboard

Manage multiple permissions and accounts from one interface.

Who It Is For

05

BotSpend supports both human-controlled and automated spending workflows.

AI & Agent Builders

Give autonomous agents controlled budgets for on-chain actions.

Web3 Teams

Delegate operational spending while maintaining clear limits and oversight.

Applications

Enable programmable payments without exposing unrestricted wallet access.

Communities & DAOs

Create controlled spending permissions for contributors and operators.

Why BOT Chain

06

BotSpend adds practical infrastructure for an ecosystem of automated applications and agents.

- **Agent-ready payments**

Programmable permissions can support autonomous services that need controlled access to funds.

- **Transparent controls**

Spending rules and transaction activity can be verified on-chain.

- **Reusable infrastructure**

Other BOT Chain applications can integrate spending controls rather than building them from scratch.

- **Ecosystem utility**

BotSpend creates a practical bridge between wallet security, payments, and autonomous execution.

Current Status & Roadmap

07

Focused on validating the core spending-control experience on testnet.

01

MVP

Spending limits, permission creation, account management, and activity tracking.

02

Testnet

Deploy contracts to BOT Chain Testnet and test end-to-end transactions.

03

Refine

Improve permissions, transaction handling, security checks, and dashboard UX.

04

Integrate

Onboard applications and agent builders that can use programmable spending.

What We Want From BOT Chain

08

Ecosystem support can help BotSpend reach developers and teams building automated applications.

- 1 Introduce BotSpend to the wider ecosystem through BOT Chain's official social media channels.
- 2 Feature BotSpend on the BOT Chain website and ecosystem/project directory.
- 3 Connect BotSpend with developers, AI-agent builders, teams, and projects that need programmable spending controls.
- 4 Amplify BotSpend's testnet launch, integrations, product updates, and major milestones.
- 5 Collaborate on campaigns, technical demos, and ecosystem activations showcasing controlled on-chain spending.

BotSpend

Give access. Set limits. Stay in control.

Programmable on-chain spending controls for teams, applications, wallets, and autonomous agents on BOT Chain.

CONTROL • AUTOMATE • TRACK
